"Web-based visualization and corpus management for language modeling"
Week 2 Report

On November 17, we had an internal meeting to discuss the first customer meeting and gather ideas. We also explored the state of the existing GUI. A lot of it can be reused, but many functionalities were only partially implemented and/or have substantial bugs. We have begun to report these bugs on Redmine. On November 18, we had another internal meeting to draft the first version of the requirements document. After the meeting, individuals made edits remotely. On November 19, we presented the draft of the requirements document to the customer. We edited the document according to the customer's suggestions and jointly prioritized the may-have features on a scale from 2 (almost must-have) to 5 (almost must-not-have). Overall, the customer was impressed with the detail of the requirements document and it is essentially ready to be signed pending some final edits.
